

Thank you so much for downloading Glitch Noises!

This sound library is the result of going through nearly a hundred hours of various digital noises and artifacts, carefully selecting, trimming and processing the best bits and samples.

All sounds in this library are genuine, produced by interpreting various binary files and memory dumps as raw audio data, and then processed to give them a subtle “digital analog” flavor. Not a single stutter has been created artificially!

With Glitch Noises, the main goal was to create an authentic sound effects library that can be used right out of the box, which is very important in the age of rapidly developing media content. The sound files are precisely trimmed and drag-and-drop ready for use in games, motion design, video editing, film production, or any project that needs a little glitch in its system.

Please send your testimonials and credits of projects that you’ve worked on using this library:

This library contains 1101 sound files in 24-bit, 48 kHz WAV format, embedded with metadata and named according to the Universal Category System standard.

Compatible with any digital audio workstation and modern game engines.

Content

- **Data** (65) — reading, scrubbing and screeching;
- **Distortions** (25) — digital nasties;
- **Glitch Bits** (150) — short artifacts;
- **Glitch Crackles** (80) — crackling and crunching;
- **Glitch Noises** (310) — glitches, bursts and screeches;
- **Intercom** (45) — interference, radio on and off;
- **Miscellaneous Noises** (45) — buzzers and various uncategorized sounds;
- **Telemetry** (45) — readout loops and short sequences, distorted telemetry;
- **User Interface** (280) — beeps, buttons and clicks, notifications, cancellations and selections, data processing sequences;
- **Bonus** (56) — designed ambiences and devices, dry and wet alarms, cinematic booms, whooshes and risers.

Sound effects found in the Bonus category are designed using sound files exclusively from this library.

Tips and Tricks

Whether you're an experienced sound designer or just starting out, here are some tips and tricks for using this library:

- Sometimes a name is just a name. If you think a certain sound could be used in a different context, then go for it! For example, a tiny glitch might be an excellent choice for hovering over buttons or scrolling menus.
- Don't hesitate to experiment with convolution reverbs and EQ to give sounds various acoustic characteristics, as if they are coming from a specific device (e.g., computers, tablets, phones, robots, etc.). A little bit of plastic or an amp cabinet can go a long way.
- Interference sounds found in the "Intercom" category work best when they're sent through the same effects chain as the rest of the tracks, rather than being completely dry. For example, if you're mixing a radio dialogue, and the implied connection is very bad, pick an interference noise and send it through the effects bus alongside the voice lines. Adjust its loudness to your liking.
